A Catalogue of Phytophagous Insects and Mites on Trees in Great Britain

Compiled by T G Winter

INTRODUCTION

The main objective of this catalogue is to bring some uniformity into exchanges concerning forest entomology. It consists of three lists: a basic one and two supplementaries.

The basic list includes all species in *Pests and Diseases of Forest Plantation Trees* (F G Brown, 1968) occurring in Britain, to which have been added many others from both the literature and from records kept by the Entomology Branch of the Forestry Commission Research and Development Division. Besides insects the list also includes some mites and several nematodes. This list was originally designed for use within the F.C. Research Division as a source of valid insect names and authors together with a selected synonymy for all species with some claim to forest importance or significance. The species included show great variability in status, some being pests of economic importance, while others are of interest only. It should be noted that some synonyms may be invalid but are included because they have been used in forest literature. The two supplementary lists provide cross-references for common English names and host plants.

The following notes explain the style of presentation of the information and the use of symbols and abbreviations.

- (a) In all three lists the use of an asterisk before an entry shows that the species has been imported in plants, timber, bark or seeds but has not been found breeding in the British Isles. Host plant records for imported species are from the literature of the country of origin and this is shown in the host plant list, e.g.

**Dendroctonus rufipennis* (Kirby) (Canada)

- (b) Some abbreviations of host plant names and insect orders have been necessary although all insect authorities are given in full. There is a complete list of these abbreviations on page vi. It should be noted that Pol (= polyphagous) is used where an insect feeds on both broad leaved and coniferous trees. However, when this abbreviation is given in brackets it signifies that the usual food plants are not trees or shrubs, e.g.

Perizoma didymata (Linnaeus) LP, SS (Pol)

This shows that the insect is sometimes found on Lodgepole pine (*Pinus contorta*) or Sitka spruce (*Picea sitchensis*).

A plant name which appears in brackets at the end of an entry is either the other host of a heteroecious aphid alternating between a tree and a herbaceous plant, e.g.

Pemphigus bursarius (Linnaeus) PO (Lettuce)

or it is the usual food plant of an insect sometimes found on trees, e.g.

Acleris hyemana (Haworth) LP, SS (*Erica*)

- (c) The host plants are mainly listed under their common English names with the scientific names cross-referenced (see List 3). Many trees are placed together in generic groups, either because the literature lacks identification to species or there is no apparent specific preference by the insect. Examples include the maples which are listed together under *Acer*, the spruces under *Picea* and the willows under *Salix*. Within such groups the host species, if known, is given after the insect in the host plant list, e.g.

ACER (Maples and Sycamore)

Acaris

Aculops acericola (Nalepa) SY

The entry shows that this mite is recorded from sycamore (*Acer pseudoplatanus*). If this record is looked up under sycamore the user is referred to ACER-SY.

This catalogue will be under continual review. The compiler will welcome any suggestions for species to be included and any corrections or other information on host plants, synonymy or common names. The data is stored in a computer file at the Forest Research Station and will be regularly updated enabling current statements to be made at any time in the future.

Acknowledgements

I must thank all my colleagues in the Entomology Branch for their help during the compilation of these lists and especially to Mr D Bevan (Head of Branch), Mr R M Brown, Mr C I Carter, Mr M R Jukes and also Dr D H Phillips, Chief Research Officer at Alice Holt until 1981 at whose suggestion this catalogue was originally started.
